Claims

- An encapsulated electrophoretic medium comprising a plurality of capsules dispersed in a polymeric binder, each of the capsules comprising a capsule wall, a suspending fluid contained within the capsule wall, and a plurality of electrically charged particles suspended in the suspending fluid and capable of moving therethrough upon application of an electric field to the medium, the polymeric binder having a shear modulus of at least about 10 mPa at 20°C.
- [c2] An encapsulated electrophoretic medium according to claim 1 wherein the polymeric binder has a shear modulus of at least about 25 mPa at 20°C.
- [c3] An encapsulated electrophoretic medium according to claim 1 wherein the polymeric binder has a shear modulus of at least about 50 mPa at 20°C.
- [c4] An encapsulated electrophoretic medium according to claim 1 wherein the polymeric binder has a shear modulus of at least about 10 mPa over a temperature range of at least 10 to 50°C.

- [c5] An encapsulated electrophoretic medium according to claim 1 wherein the polymeric binder comprises a polyurethane.
- a layer of an encapsulated electrophoretic medium comprising a plurality of capsules dispersed in a polymeric binder, each of the capsules comprising a capsule wall, a suspending fluid contained within the capsule wall, and a plurality of electrically charged particles suspended in the suspending fluid and capable of moving therethrough upon application of an electric field to the medium, the polymeric binder having a shear modulus of at least about 10 mPa at 20°C; and at least one electrode adhered to the layer of encapsulated electrophoretic medium, the binder having a peel strength from the electrode of at least about 2 lb/inch.
- [c7] An electro-optic display according to claim 6 wherein the binder has a peel strength from the electrode of at least about 4 lb/inch.
- [08] An electro-optic display according to claim 6 wherein the polymeric binder comprises a polyurethane.
- [c9] An electro-optic display comprising a support member

having a support surface, a plurality of spacer members extending in one direction away from the support surface, a protective sheet contacting the ends of the spacer members remote from the support surface, and an electro-optic medium supported by the protective sheet.

- [c10] An electro-optic display according to claim 9 further comprising a second protective sheet disposed on the opposed side of the electro-optic medium from the protective sheet contacting the ends of the spacer members.
- [c11] An electro-optic display according to claim 9 wherein the electro-optic medium has the form of an interrupted layer, the electro-optic medium not being present immediately adjacent the areas of the protective sheet contacting the ends of the spacer members.
- [c12] An electro-optic display according to claim 9 wherein the electro-optic medium is an encapsulated electrophoretic medium.
- [c13] An electro-optic display according to claim 9 further comprising a layer of resilient material disposed between the support surface and the protective sheet.
- [c14] An electro-optic display according to claim 13 wherein the resilient material comprises a solid foam.

- [c15] A tensioned member display comprising a support member having a support surface, a plurality of spacer members extending in one direction away from the support surface, a plurality of tensioning members each extending upon tension between at least two of the spacer member, and an electro-optic medium through which the support members pass, the electro-optic medium being supported spaced from the support surface by the tensioning members passing through the electro-optic medium.
- [c16] A tensioned member display according to claim 15 wherein the support members are arranged in two parallel rows with the tensioning members extending parallel to each other between one support member in each row.
- [c17] A tensioned member display according to claim 15 further comprising at least one protective layer sheet disposed adjacent the electro-optic medium.
- [c18] A tensioned member display according to claim 15 further comprising at least one electrode disposed adjacent the electro-optic medium.
- [c19] A tensioned member display according to claim 15 fur ther comprising at least one of a load distributing mem ber and a layer of resilient material disposed between

the electro-optic medium and the support surface.

[c20] A tensioned member display according to claim 15 wherein the electro-optic medium is an encapsulated electrophoretic medium.
